

SEMICONDUCTOR SUPPLY CHAIN INTELLIGENCE MAP

See how a disruption moves - without hiding the assumptions.

An explainable, deterministic research platform for mapping structure, tracing shocks, comparing scenarios, and reviewing evidence.

Project overview - snapshot 2026-07-29

LIVE PROJECT SCREENSHOT

Public landing page

Capture required: landing.png

Static maps show where. SSCIM explores what changes.

Semiconductor production is globally distributed yet concentrated at critical stages. A single rule, outage, earthquake, or capacity decision can propagate far beyond its origin.

The question

Given this event and these stated assumptions, which modeled stages, companies, and countries become more

What SSCIM refuses to claim

- No probability of disruption
- No realized financial loss
- No measured trade volume
- No investment signal
- No hidden confidence weighting

A single product surface connects structure, events, and evidence.

LIVE PROJECT SCREENSHOT

Dashboard map with live reviewed vault data

Capture required: dashboard-map.png

24

production stages

34

directed dependencies

109

modeled companies

56

reviewed live events

Also represented: 16 countries, 243 supplier/customer relationships, 75 ownership records, and 7 policy instruments.

A reader moves from evidence to explanation in five steps.

Interpretation rule

A high score is a question to investigate, not an answer. Use the source and assumptions to decide whether the modeled pathway is credible.

One selection, three synchronized views.

LIVE PROJECT SCREENSHOT

World map - production geography

Capture required: dashboard-map.png

LIVE PROJECT SCREENSHOT

Industry flow - stage dependencies

Capture required: dashboard-flow.png

LIVE PROJECT SCREENSHOT

Topology - country x stage centres

Capture required: topology.png

MAP

Country exposure aggregated from where production occurs - not headquarters.

INDUSTRY FLOW

Stage structure and declared input-dependence priors reveal why a shock spreads.

TOPOLOGY

Derived functional centres and modeled routes support path and resilience analysis.

The model keeps structure and current impact deliberately separate.

STRUCTURAL VULNERABILITY

What is fragile here even before today?

Graph/data:

- network influence
- geographic concentration
- policy exposure

Analyst judgment:

- substitutability
- market sensitivity

OPERATIONAL IMPACT

What do selected events do now?

Signed shock field

- 5 is neutral
- above 5 is adverse pressure
- below 5 is mitigating
- ages against the frozen snapshot date
- scenarios are comparisons, never history

Keeping these numbers separate prevents one score from moving for two incompatible reasons.

Every operational score follows the same declared computation.

Confidence is evidence metadata. It is never multiplied into the magnitude.

Topology turns the stage graph into an interactive resilience laboratory.

LIVE PROJECT SCREENSHOT

Functional-centre topology and route analysis

Capture required: topology.png

Functional centres

Country x production-stage nodes derived from the same vault.

Routes

Click origin and destination to expose modeled dependency paths.

Stress tests

Remove links, compare alternatives, and inspect scenario deltas.

Honest boundary

Connections are not trade flows, shipping lanes, or direct contracts.

Publication is a controlled evidence pipeline, not an AI autopilot.

Authority boundary

AI may draft a proposal. Only a human decision can admit an event to the vault, and only a passing audit/test gate can publish it.

The review dashboard preserves both accepted and rejected evidence.

LIVE PROJECT SCREENSHOT

Admin decision history with source records

Capture required: admin-history.png

12

approved
candidates

16

rejected
candidates

0

pending review

0

unpublished
decisions

Each record retains the original URL, raw source payload, AI proposal, reviewer decision, timestamp, and duplicate flags.

History stays useful even when the local API is offline.

COMPUTED CHAIN-INDEX HISTORY

3 days | 7 days | 30 days | 6 months | 1 year
| 5 years | all time

7.56 archived baseline chain index
on 2026-07-29

Resilient publication

GitHub Pages keeps serving the last audited snapshot when the PC, tunnel, or API is unavailable.

A hybrid architecture separates public availability from private write authority.

READ PATH

WRITE PATH

Scheduled writer

The daily local pipeline fetches, deduplicates, drafts, ages events, refreshes quotes, exports, archives, verifies, commits, and pushes. No public browser can write directly to GitHub.

Transparency is the trust model.

A / B / C

peer-reviewed, institutional, and official primary evidence

D

declared analyst judgment, labeled rather than hidden

GRAPH

deterministic output computed from the versioned snapshot

CONFIDENCE

evidence quality shown beside magnitude, never folded into it

Reproduce a result with:

1. repository commit
2. snapshot date
3. event or scenario id
4. topology removals
5. low / base / high sensitivity case

Declared priors are inspectable - and explicitly uncalibrated.

Documentation gives every audience a different doorway into the same system.

LIVE PROJECT SCREENSHOT

GENERAL PUBLIC

plain-language guide and interpretation limits

ANALYSTS

methodology, events, sources, and scenario workflow

ACADEMICS

reproducibility, evidence tiers, validation boundary

DEVELOPERS

architecture, data contracts, tests, and publication

The roadmap is a data program before it is a modeling program.

Facility layer

actual production sites, capacity, utilization, and geography

Buffer layer

inventory days, time-to-recover, and time-to-switch

Dependence layer

bill of materials, buyer input share, supplier revenue share

Qualification layer

alternate suppliers and switching feasibility

Calibration layer

historical disruption outcomes and goodness-of-fit

Until those layers exist, SSCIM remains a transparent sensitivity model - not a forecast or loss estimator.

EXPLAINABLE BY CONSTRUCTION

Explore the chain. Challenge the assumptions. Improve the evidence.

SSCIM makes the method visible, keeps human review authoritative, and preserves a usable public snapshot even when the live backend is offline.
